EMPLOYMENT FORECAST SURVEY
SECOND REPORT
May, 1956

Projections of employment indices to July 1, and October 1, 1956 for manufacturing industries, and other selected industries, based upon quantitative forecasts made by approximately 800 establishments, with supplementary qualitative data, tables and charts.

DEPARTMENT OF LABOUR
ECONOMICS AND RESEARCH BRANCH

Presented to the

UNIVERSITY OF TORONTO
by
D.G. HARTLE

FOREWORD

This is the second Employment Forecast Survey report for the year 1956. This report includes employment indices projected to target dates at July 1 and October 1, 1956. The projections are based solely on the forecasts for those dates made by a sample of establishments in March.

The latest revised D.B.S. employment indices, and projections of these indices, are provided for the manufacturing and certain selected non-manufacturing industries. All D.B.S. employment indices have been adjusted for strikes. The D.B.S. and projected indices for the manufacturing group and the three economic groups within manufacturing also have been seasonally adjusted for the discussion in the "Employment Outlook".

"The Employment Outlook" statement, which follows immediately after the table of contents, summarizes the most significant aspects of the projected indices given in this report. The projections for individual industries and groups are given in the body of the report in tabular and graphic form, with a summary of the accuracy of the previous projections for each industry.

The first report for 1956 included in the section entitled "Concepts and Methods" a detailed description of the procedures under which employment indices are projected. Any changes from the procedures outlined in that statement are described in this report in the section entitled "Notes".

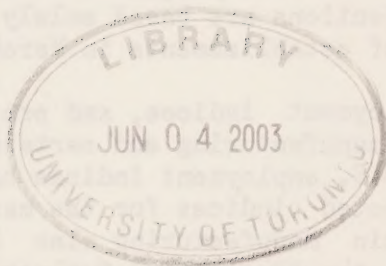

A new procedure designed to give the interview reports of field representatives wider circulation is in the process of initiation. This material, which was summarized as "Employers' Comments" in previous E.F.S. reports, will be available on request to recipients of this report.

The "Employment and Unemployment Outlook" statement, which previously appeared as part of the E.F.S. report, is now published separately twice each year and is available on request.

FOREWORD

This is the second Equipment Failure Survey report for the year 1988. This report includes equipment failures reported to the Survey Office for the period from July 1 to October 1, 1988. The information is presented in the form of a summary of the data collected.

The latest revised B.E.S. equipment failure data, which are provided for the Survey Office, are presented in the form of a summary of the data collected. The B.E.S. and the Survey Office have been working together to improve the quality of the data collected. The Survey Office has been working to improve the quality of the data collected.

The Equipment Failure Survey Office, which follows immediately after the table of contents, summarizes the most significant aspects of the equipment failures given in this report. The information for individual equipment failures is given in the body of the report in tables and graphs, and with a summary of the summary of the previous year's report for each category.

The first report for 1988, included in the section entitled "Summary and Remarks," a detailed description of the procedures used which equipment failures are presented. Any changes from the previous year are indicated in this report in the section entitled "Remarks."

A new procedure designed to give the Survey Office a more complete representation of what is happening in the process of equipment failure. This material, which was summarized as "Equipment Failure" in previous B.E.S. reports, will be available as a separate report at this time.

The "Equipment Failure Survey Office" statement, which previously appeared as part of the B.E.S. report, is now published separately each year and is available as a separate report.

GENERAL EMPLOYMENT OUTLOOK

July 1, and October 1, 1956

The employment indices projected in this Employment Forecast Survey report indicate that, with the exception of the basic materials group, employers in the manufacturing industries expect non-seasonal gains in employment from January 1 to July 1, 1956. The projected indices also show that, with the exception of the consumer finished goods group, the sample establishments expect small non-seasonal declines in employment from July to October of this year.

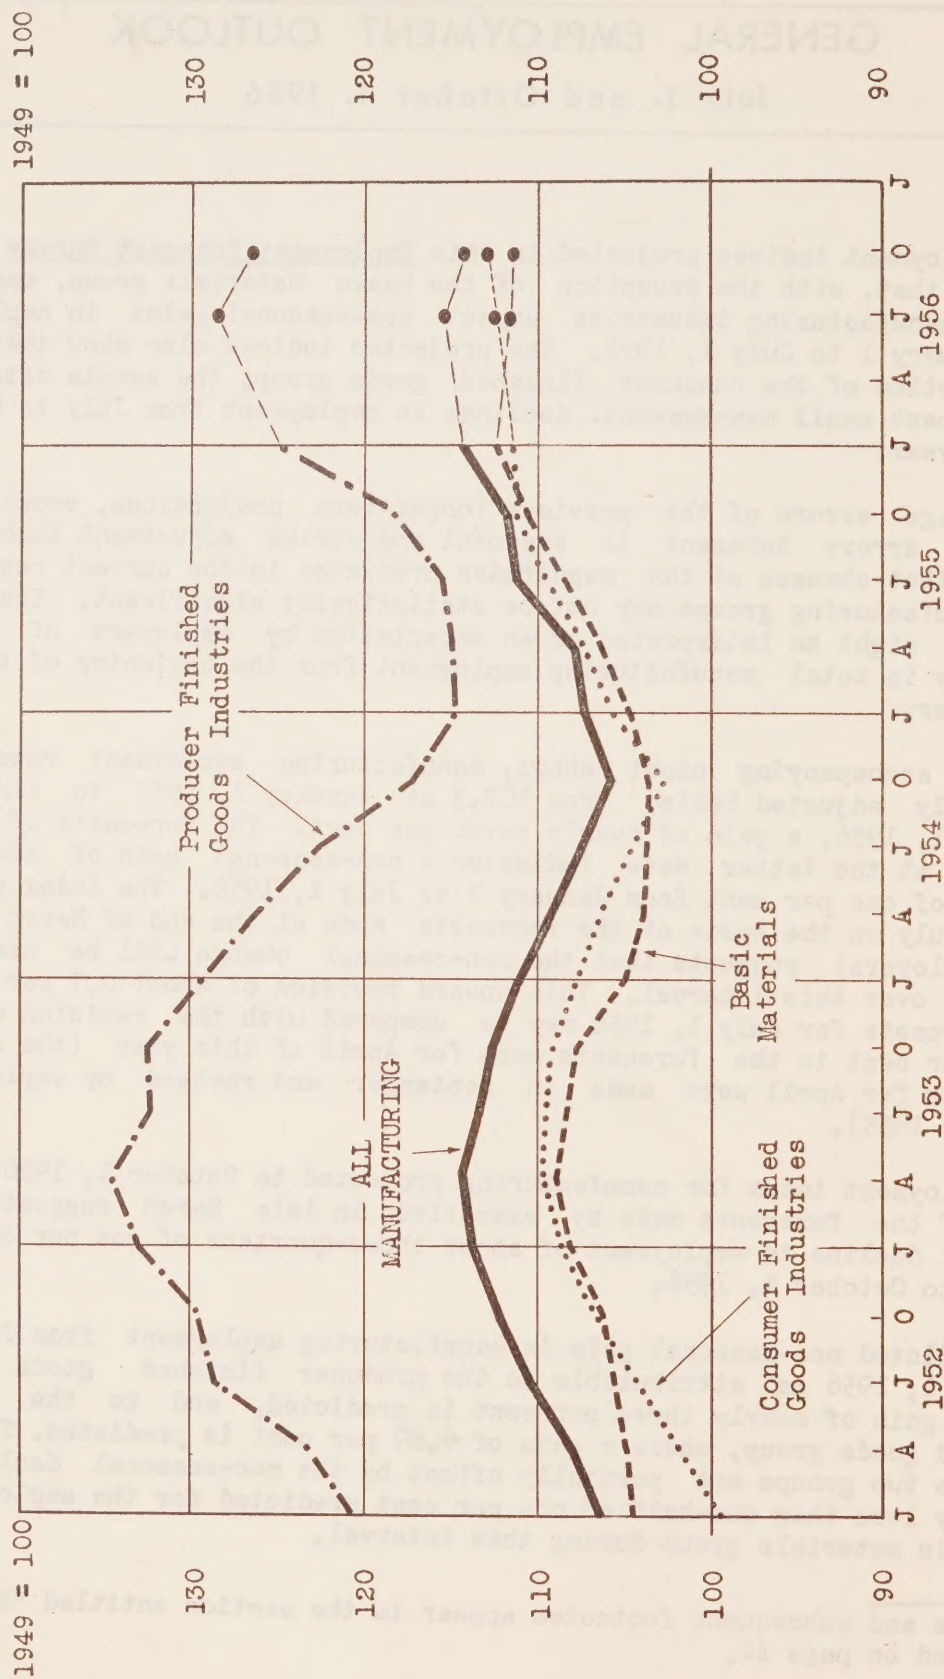

The average errors of the previous longer-term projections, coupled with possible errors inherent in seasonal and strike adjustment techniques, suggest that changes of the magnitudes predicted in the current report for the manufacturing groups may not be statistically significant. These projections might be interpreted as an expectation by employers of virtual stability in total manufacturing employment from the beginning of the year to October.

As the accompanying chart shows, manufacturing employment rose, on a seasonally adjusted basis, from 107.3 at January 1, 1955 to 114.1 at January 1, 1956, a gain of nearly seven per cent. The forecasts of employers made at the latter date indicated a non-seasonal gain of about one-quarter of one per cent from January 1 to July 1, 1956. The index projected for July on the basis of the forecasts made at the end of March (by the same employers) suggests that the non-seasonal change will be nearly 1.0 per cent over this interval. This upward revision of about 0.7 per cent in the forecasts for July 1, 1956 may be compared with the revision of about three per cent in the forecasts made for April of this year (the original forecasts for April were made in September and revised by employers in December 1955).

The employment index for manufacturing projected to October 1, 1956 on the basis of the forecasts made by executives in late March suggests a non-seasonal decline in employment of about three-quarters of one per cent from July 1 to October 1, 1956.

The predicted non-seasonal gain in manufacturing employment from January 1 to July 1, 1956 is attributable to the producer finished goods group, where a gain of nearly three per cent is predicted, and to the consumer finished goods group, where a gain of 0.89 per cent is predicted. The gains in these two groups are partially offset by the non-seasonal decline of slightly less than one-half of one per cent predicted for the employment of the basic materials group during this interval.

(1) This and subsequent footnotes appear in the section entitled "Notes", found on page 42.

Note: The data are taken from monthly machine runs provided by the Labour and Prices Division, D.B.S., and have been strike adjusted. The moving seasonal indices were computed by the Economics and Research Branch of the Department of Labour. Projections are from the second quarterly Employment Forecast Survey, 1956.

The decline in manufacturing employment from July 1 to October 1, 1956 is derived from the predicted non-seasonal declines in the basic materials and producer finished goods groups of 0.45 and 1.71 per cent, respectively. The only gain during the July-October interval is predicted for the consumer goods group, where a non-seasonal increase of slightly less than one-half of the one per cent is expected.

The accompanying bar chart shows the year-to-year changes projected for individual industries in the manufacturing group for October 1, 1956. Decreases in employment are predicted for eight industries, but for four of these industries the declines expected by employers suggest absolute drops of no more than one hundred employees. The larger declines are predicted for the wood products industry, where an absolute decline of 2,900 employees is expected, and the shipbuilding industry, where a decline of 1,900 workers, or about 8.8 per cent of the total employment of the industry, is predicted.

The year-to-year changes predicted at October 1, 1956 for the other industries are positive in all instances, as the bar chart indicates. The largest absolute gains are expected in the electrical apparatus, railway rolling stock, industrial machinery, and fabricated iron and steel industries. The absolute gains predicted for these industries range from 3,000 employees for the electrical apparatus industry to 7,000 employees for the fabricated iron and steel industry. The largest year-to-year percentage change in employment is predicted for the railway rolling stock industry.

The net result of the predicted increases and decreases in the employment of the individual industries is a predicted gain of 27,600 employees in manufacturing as a whole, which gives an expected year-to-year gain of 2.3 per cent.

The levels of the year-to-year gains predicted for the manufacturing industries are matched or surpassed, generally speaking, by the predictions which have been derived for the selected non-manufacturing industries.

The forecasts of employment made for the British Columbia logging industry lead to a projected year-to-year decline of 0.3 per cent at July 1, 1956. The current projections for October 1 of this year indicate that the year-to-year change predicted for July will rise by about 2.5 percentage points from July to October.

For the logging industry in the rest of Canada substantial year-to-year gains are predicted at July, with a suggested increase of 12.2 per cent. The index projected for this industry at October 1, 1956 indicates that this year-to-year gain will narrow after July, but this is partly due to the increases in employment during this interval in the previous year.

An employment index of 110.8 is projected for department stores at July 1, 1956. If this level is achieved, a year-to-year gain of more than 8.5 per cent in the employment of this industry will have been realized. A marked year-to-year gain is also projected for October of this year.

The year-to-year gains predicted for the communications, electric power and mining industries seem to be consistent with long-term growth factors.

NOTES

NOTES

(1) All strike adjustments were made by increasing the reported number of employees (E.&P.) in the affected industry by the number of employees reported on strike or laid off because of the strike, by the Economics and Research Branch, Department of Labour. These strike adjusted employment figures for the industry were divided by the base period employment of the industry on the date for which the adjustment was made. Strike adjustments were made for all industries in which one per cent or more of total employment in the industry was involved.

(2) No accuracy data are shown for department stores and mail order houses, because the forecasts were formerly derived entirely from the E.F.S. sample.
